

How to Interact with this Jupyter Notebook

This notebook contains executable code combined with instructions to guide you through the activity.

Scenario: The Rectangle Riddle

You've just started your internship at Code Wizards Inc., a leading software development firm. On your first day, you're given a Python script that calculates the area of a rectangle. It's not working correctly, though. Your supervisor mentions there's a small error and challenges you to find and fix it.

Instructions:

- Carefully read the provided code snippet and then run it.
- The code defines the length and width of a rectangle, calculates the area, and then attempts to print the result.
- Pay close attention to the output - is the calculated area correct?

Hints

- **Identify and Fix the Error:** If the output isn't what you expected, use your knowledge of how to calculate the area of a rectangle ($\text{area} = \text{length} * \text{width}$) to spot the error in the code. Modify one line of code to correct the calculation.
- **Run the Program Again:** Execute the modified script and verify that it now calculates and prints the area of the rectangle correctly. The output should clearly state the calculated area.

```
In [1]: # The Code

length = 5
width = 3

# Calculate the area
area = length + width # Modify this line of code

# Print the result
print("The area of the rectangle is:", area)
```

The area of the rectangle is: 8

Solution

```
In [2]: # The Code
```

```
length = 5
width = 3

# Calculate the area
area = length * width # Modify this line of code

# Print the result
print("The area of the rectangle is:", area)
```

The area of the rectangle is: 15
